

Swag Labs - QA Bug Report

Website: SauceDemo
Testing Type: Manual / Exploratory
Prepared by: Nand Kishor Gorain
Date: 05-Sept.-2026

Bug Summary

ID	Bug Title	User	Severity	Priority
BUG-001	<u>Empty cart can be checked out</u>	standard_user	High	High
BUG-002	<u>Invalid product disappears from cart</u>	problem_user	High	High
BUG-003	<u>Product actions affect wrong product</u>	problem_user	High	High
BUG-004	<u>Finish button fails to complete checkout</u>	error_user	High	High
BUG-005	<u>Last Name input corrupts First Name</u>	problem_user	High	High
BUG-006	<u>Incorrect checkout pricing via direct navigation</u>	problem_user	High	High
BUG-007	<u>Product information inconsistent across pages</u>	problem_user	Medium	High
BUG-008	<u>Remove behavior differs between Inventory and Cart</u>	error_user	Medium	Medium
BUG-009	<u>Validation incorrectly marks multiple fields</u>	problem_user	Medium	Medium
BUG-010	<u>Add to Cart fails for some products</u>	problem_user	High	High

Total defects logged: 10 | High severity: 7 | Medium severity: 3

BUG-001: Empty cart can be checked out

Severity: High

Priority: High

User: standard_user

Before you start

Log in as standard_user.

Steps to reproduce

1. Log in as standard_user
2. Go to the cart
3. Make sure the cart is empty
4. Click Checkout
5. Enter your details
6. Click Continue
7. Click Finish

What should happen

The app should stop checkout when the cart is empty.

What happens instead

Checkout goes through and shows an order confirmation, even though the cart has no items in it.

Why this matters

This lets someone place an order with no product in it. That can create bad orders and cause problems later when orders are processed.

Frequency: Happens every time

BUG-002: Invalid product disappears from cart

Severity: High

Priority: High

User: problem_user

Before you start

Log in as problem_user.

Steps to reproduce

1. Log in as problem_user
2. Go to the Inventory page
3. Find the product that shows wrong or invalid info
4. Click Add to Cart for that product
5. Open the cart

What should happen

The product should be added to the cart and show up with the right name, description, and price.

What happens instead

The product seems to be added on the Inventory page, but it does not show up in the cart.

Why this matters

The app tells the user the product was added, but it is not really in the cart. Users may think they bought something that will not be part of their order.

Frequency: Happens every time with the affected product

BUG-003: Product actions affect wrong product

Severity: High

Priority: High

User: problem_user

Before you start

Log in as `problem_user` and go to the Inventory page.

Steps to reproduce

1. Log in as `problem_user`
2. Go to the Inventory page
3. Find the products with ID 4 and ID 5
4. Click Add to Cart for product ID 4
5. Check which product actually got added to the cart
6. Do the same test for product ID 5
7. Repeat the test for the products with ID 2 and ID 3

What should happen

Each Add to Cart or Remove click should only affect the product you clicked.

What happens instead

The actions get mixed up. Clicking product ID 4 or ID 5 both end up affecting product ID 5. The same mix up happens with product ID 2 and ID 3.

Why this matters

Users can add or remove the wrong product without knowing it. This can lead to a wrong cart, wrong product picks, and wrong orders.

Frequency: Happens every time for these product pairs

BUG-004: Finish button fails to complete checkout

Severity: High

Priority: High

User: error_user

Before you start

Log in as `error_user` and have at least one product in the cart.

Steps to reproduce

1. Log in as `error_user`
2. Add any product to the cart
3. Open the cart
4. Click Checkout
5. Enter your first name, last name, and postal code
6. Click Continue
7. On the Checkout Overview page, click Finish

What should happen

The order should complete and take the user to the order confirmation page.

What happens instead

Clicking Finish does not complete checkout. The user stays on the Checkout Overview page and no confirmation shows up.

Why this matters

Users cannot finish their purchase even after going through the whole checkout flow. This blocks orders for this account.

Frequency: Happens every time with `error_user`

BUG-005: Last Name input corrupts First Name

Severity: High

Priority: High

User: problem_user

Before you start

Log in as `problem_user`, add a product to the cart, and go to the Checkout: Your Information page.

Steps to reproduce

1. Log in as `problem_user`
2. Add a product to the cart
3. Open the cart and click Checkout
4. Type something in the First Name field
5. Click the Last Name field
6. Type a last name with more than one letter
7. Look at what shows up in both fields

What should happen

First Name and Last Name should each keep their own value. Typing more than one letter in Last Name should show the full text there.

What happens instead

Typing in the Last Name field changes First Name instead. Only one letter sticks at a time, and each new letter replaces the one before it.

Why this matters

Users cannot enter their name correctly at checkout. This can stop them from finishing checkout and can lead to wrong customer info on the order.

Frequency: Happens every time with `problem_user`

BUG-006: Incorrect checkout pricing via direct navigation

Severity: High

Priority: High

User: problem_user

Before you start

Log in as `problem_user` and have a product in the cart.

Steps to reproduce

1. Log in as `problem_user`
2. Add a product to the cart
3. Go to the Checkout: Your Information page
4. Enter your customer info
5. Go straight to the Checkout Overview page using its URL, instead of clicking through the normal steps
6. Look at the prices and totals shown

What should happen

The Checkout Overview page should show the correct item price, subtotal, tax, and total, no matter how you reach the page.

What happens instead

When you open the Checkout Overview page directly by URL, the prices and totals shown are wrong.

Why this matters

Wrong prices at checkout can show users the wrong total, and can lead to the wrong amount being charged or saved for an order.

Frequency: Happens every time the page is opened this way with `problem_user`

BUG-007: Product information inconsistent across pages

Severity: Medium

Priority: High

User: problem_user

Before you start

Log in as `problem_user` and go to the Inventory page.

Steps to reproduce

1. Log in as `problem_user`
2. Go to the Inventory page
3. Pick a product and note its name and description
4. Open that product's Product Details page
5. Compare the name and description with what you saw on the Inventory page
6. Do the same check for the affected product

What should happen

The product name, description, and other details should stay the same on both the Inventory page and its Product Details page.

What happens instead

The Product Details page can show different info than the Inventory page. For one product, the details page shows `Not Found` as the name and `sqrt(-1)` as the price.

Why this matters

Mismatched product info can confuse users and make them trust the catalog less. Showing `Not Found` for a product that looked fine on the Inventory page makes it unclear if the item is really available. The broken price also shows the product data itself is corrupted.

Frequency: Happens every time for the affected product with `problem_user`

BUG-008: Remove behavior differs between Inventory and Cart

Severity: Medium

Priority: Medium

User: error_user

Before you start

Log in as `error_user`. Products should be showing on the Inventory page.

Steps to reproduce

1. Log in as `error_user`
2. Go to the Inventory page
3. Add a product to the cart
4. Go back to the Inventory page
5. Click Remove for that same product
6. Check whether the product actually gets removed
7. Open the cart and find the same product
8. Click Remove on the Cart page

What should happen

Remove should work the same way and take the product out of the cart, whether you click it on the Inventory page or the Cart page.

What happens instead

Clicking Remove on the Inventory page does not remove the product for `error_user`. Remove works fine when you do it from the Cart page.

Why this matters

This stops users from managing their cart straight from the Inventory page. They have to go to the cart to remove items instead.

Frequency: Happens every time with `error_user`

BUG-009: Validation incorrectly marks multiple fields

Severity: Medium

Priority: Medium

User: problem_user

Before you start

Log in as `problem_user`, add a product to the cart, and go to the Checkout: Your Information page.

Steps to reproduce

1. Log in as `problem_user`
2. Add a product to the cart
3. Open the cart and click Checkout
4. Fill in the form correctly, but leave one field wrong or empty
5. Submit the form
6. Look at which fields show an error

What should happen

Only the one field with bad or missing info should show an error. Fields with correct info should stay marked as valid.

What happens instead

When one field has an error, every field on the checkout form shows an error, even the ones filled in correctly.

Why this matters

Wrong error messages confuse users and make it hard to tell which field actually needs fixing. This adds extra friction at checkout and can stop people from finishing their purchase.

Frequency: Happens every time with `problem_user`

BUG-010: Add to Cart fails for some products

Severity: High

Priority: High

User: problem_user

Before you start

Log in as problem_user and go to the Inventory page.

Steps to reproduce

1. Log in as problem_user
2. Go to the Inventory page
3. Pick a product that has an Add to Cart button
4. Click Add to Cart
5. Check the button and the cart count
6. Do the same for the other products on the page

What should happen

Clicking Add to Cart should add that product to the cart and change the button to Remove. The cart count should go up too.

What happens instead

Add to Cart does not work for about half of the products on the Inventory page. The rest add normally.

Why this matters

Users cannot add some products to their cart even though those products look available. This blocks purchases for those items and makes shopping inconsistent across the catalog.

Frequency: Happens every time for the affected products with problem_user
